|--|--|--|--|-------------|------------|--|
|  |  | Construction wastes will have a moderate impact  | b. Collect cement sacks, excess steel bars and lumber and place in the MRF |             |            |  |
| 2. Temporary increase in sedimentation                                     | Alteration in identified landscape and elevation due to excavation to minimize the slope and mitigate soil erosion   | a. Earthmoving/cutting of slopes to be done during dry months.<br><br>b. Generated soil/spoil materials will be stockpiled in small mounds and buttressed appropriately with bunds and provided with drainage canal and siltation ponds.<br><br>c. Slope should be planted with grasses to prevent erosion | Construction Phase   | By Contract | Contractor |  |
| 3. Potential Contamination of surface and ground water with oil and grease | Waste oil and grease from equipment could moderately contaminate surface water   | a. Check equipment for leaks and repair as necessary<br><br>b. Observe proper storage of fuel materials  | Construction phase   | By contract | Contractor |  |
| 4. Potential contamination with human waste                                | Workers would be mostly locals and are expected to go home to their respective houses after work   | Set up adequate toilet facility at the base camp   | Construction phase   | By contract | Contractor |  |
| 5. Potential disruption of traffic flow                                    | The access road and/or segments to be rehabilitated need is vital to daily activities of the residents and farmers and need to be kept open to traffic during construction | a. Keep the road open to traffic flow and minimize disruptions along the access road and/or construction area  | Construction phase   | By contract | Contractor |  |
